

## Model Structure

Outcome variables: - Trump wins

- Kamala wins.

Predictor variables: - enc date?

- state ?

Can be { - numerical grade? (for quality)

moved to { - Pollsters ?  
others.

## How to clean Data.

- we want Trump & Morris : candidate - name.

- we want only certain states. State > filter out national votes (state is N/A).

- high quality data: grade > J.O, score > 5.

- Convert Nebraska into correct name.

We want graphs: (how to get this?). We need to model pct over period of time for both of them.
